EXPERIMENT 6

Develop Pig Latin scripts to sort, group, join, project, and filter the data

Aim: To develop a Pig Latin scripts to sort, group, join, and filter the data.

Theory:

Pig Latin is a high-level scripting language used with **Apache Pig**, a platform for analyzing large data sets in **Big Data** environments. It provides an abstraction over **MapReduce**, making data processing simpler and more efficient. Pig Latin is a powerful tool in the Big Data ecosystem, especially for working with **Hadoop**. It simplifies data processing and analysis, making it a popular choice for handling large-scale data transformations. Writing MapReduce jobs in Java can be cumbersome. Pig Latin reduces the complexities. Can handle both **structured** and **semi-structured** data. Apache Pig automatically optimizes the execution of scripts. Works well with **Hadoop Distributed File System (HDFS)** and other Big Data tools. Allows users to define **User-Defined Functions (UDFs)** in Java, Python, or other languages.
