EXPERIMENT 5

Implement Functions: Count – Sort – Limit – Skip – Aggregate using MongoDB

Aim: Implement Functions: Count – Sort – Limit – Skip – Aggregate using MongoDB

Theory:

MongoDB is a **NoSQL** database that stores data in a **flexible, JSON-like format** called **BSON** (Binary JSON). It is designed to handle large volumes of unstructured or semi-structured data with high performance and scalability.

Count - Returns the number of documents that match a query.

Sort- Orders the result set by one or more fields.

Limit- Restricts the number of documents returned.

Skip- Skips a specified number of documents in the result set.

Aggregate- Processes data records and returns computed results. Used for **grouping, filtering, joining, projecting, and transforming** data.

Procedure:
